PREFACE

This volume is a component part of the fourth edition of the State and Local Report Series, *Employment, Mobility, and Personal Characteristics of Newly Licensed Nurses*. For the first two editions (1977 and 1978) the data were collected, analyzed, and published exclusively by the National League for Nursing. For the third edition (1979) the Series was published by the Health Resources Administration in cooperation with the National Technical Information Service. For the fourth edition (1980), responsibility for publication has again been assumed by NLN.

The State and Local Reports constitute a significant resource for monitoring the dynamics of nursing manpower. Timely, up-to-date, and relevant, these statistics provide information on the relations of supply, demand, and distribution of nurses. The series consists of: Volume 1, the *State Summaries*, which supplies this information by state, with a national summary for all variables; and Volumes 2-50, the individual state reports, which give the same data on a local basis (by HSA and by county). In the first three editions, all volumes were published in book form. In the fourth edition, only Volume 1, the *State Summaries*, is being published conventionally; Volumes 2-50 will be made available on microfiche.

Planners of nursing education, whether for a state, a locality, or an institution, will find the volumes of the Report Series especially helpful, since the data describe the relations between the residence of the newly licensed nurse and the location of school of graduation. Such information can be used to determine net flows of nursing students within and between local areas and states. Legislators will find these data useful as a measure of the dependence of local areas and states on outside sources for the preparation of nurses. Conversely, the data provide estimates of the degree to which individuals from the outside are subsidized by the local area or state institutions of learning.

Both planners of nursing education and employers of nurses will find the data on employment and job hunting of particular significance. The value of current statistics on employment status and unemployment is self-evident. The analysis of job hunting experiences is equally important for delineating the subtler dimensions of the job market for nurses in local areas, thereby bringing perspective to a question that often becomes charged emotionally.

Finally, the value of these statistics in analyses of nursing manpower should not be forgotten. In developing procedures for projecting nursing supply, demands, needs, and requirements, manpower researchers will find the information on trends in relevant parameters that are being assembled yearly in the Survey of Newly Licensed Nurses a useful contribution. Another significant area of research, the question of women in the labor force, can make use of this continuing study of the forces and influences that modify the labor force behavior of individuals in an occupation that remains composed primarily of women.

We believe that this volume and the entire series will be helpful to those persons responsible for planning, recruiting, or research in the area of health manpower.

INTRODUCTION

GUIDELINES FOR UTILIZATION OF THE DATA

This edition of the National League for Nursing State and Local Report Series on Newly Licensed Nurses presents data on 45 variables on nurses newly licensed in 1980 in 48 states and the District of Columbia.[1] In Volume 1, the *State Summaries*, the data are displayed by state, while in Volumes 2-50, the individual state reports, the data are displayed by county and health service area (HSA); all tabulations cover both registered nurses and practical/vocational nurses.

The 45 variables pertain to employment status, description of the circumstances of employment, geographic mobility, and personal characteristics of the newly licensed nurses, all elements important in planning, policy making, and financing of health care and nursing education.

THE NLN DATA SERVICE

The NLN Data Service had its inception in a feasibility study of registered nurses newly licensed in July 1975 and practical nurses newly licensed in October 1975. Conducted in 1976 and supported by a grant from the Robert Wood Johnson Foundation, this feasibility study is described in *A Report of NLN's Data Service on Newly Licensed Nurses.*[2]

Beginning in 1977, the Data Service offered to provide all programs of nursing education with individualized and confidential reports on the status of their newly licensed graduates. The service is offered in the spring of each year on newly licensed graduates of the previous year and is now available on a subscription basis.

The main elements of the methodology and data collection procedures of the annual Survey of Newly Licensed Nurses are as follows:

1. A simple, brief, machine-readable questionnaire is addressed by computer and sent by first-class mail to all nurses in participating states about six months after licensure.[3] Since all newly licensed nurses receive the questionnaire, an important source of error, sampling error, is eliminated.

2. One follow-up mailing to individuals not responding to the first questionnaire is made. Considering the mass nature of the survey, the overall response rate to the two mailings has been good, tending to be around 70 percent.

3. The survey is particularly strong in charting the geographic mobility of newly licensed nurses. This is made possible by the

---

[1] States not included in 1980 are Iowa and Oklahoma. Also excluded are practical nurses newly licensed by California.

[2] A copy of this report may be obtained free from the NLN Division of Research, 10 Columbus Circle, New York, NY 10019.

[3] State Boards of Nursing must authorize access by the NLN Division of Research to the names and addresses of newly licensed nurses. In the 1980 survey, only two states (Iowa and Oklahoma) did not participate and are therefore missing from the Report Series.

process of linking zip codes of various addresses (residence at licensure, current residence, address of current employer, address of school of graduation) with county, HSA, and state FIPS (Federal Information Processing Standards) code counterparts.

The local report series is perhaps the most important component of the Data Service. Fifty volumes will be issued during the course of 1982. The first volume, *State Summaries*, establishes the format that is followed for the separate reports on 48 states and the District of Columbia.

ORGANIZATION OF THE TABULATIONS FOR THE STATE SUMMARIES

Newly licensed nurses may have moved to one or more different areas from the time of entry into a program of nursing education until graduation, licensure, and, eventually, employment. In order to capture and describe these dynamics of movement, three populations of newly licensed nurses are studied in this volume in relation to each local area (county and HSA).

Part A tabulates statistics by state on newly licensed nurses by address reported at the time of licensure; Part B, by residence at the time of survey (about six to eight months after licensure); and Part C, by employment at the time of survey.

There is, of course, much overlap among these three populations. Those newly licensed nurses who resided in an HSA at time of licensure, who continue to reside there, and who are currently employed there will appear in Parts A, B, and C. On the other hand, nurses who moved into or out of an HSA since licensure, or who are not employed, will appear only in the appropriate Parts of the analysis.

To provide a better understanding of the three-part analysis and the linkages among the populations, circular schematic figures are shown on page 3. Figure I displays all newly licensed nurses having any relationship with an HSA. Group 1 consists of individuals who did reside and continue to reside in an HSA. Group 2 contains those individuals who left the HSA after licensure; and Group 3, nurses who moved to the HSA following licensure. In Figure II, the population of study includes Groups 1 and 2 (Part A analysis of residents at time of licensure) but excludes Group 3. Figure III, on the other hand, excludes Group 2 and includes Groups 1 and 3 from the Part B analysis of current residents. Finally, Figure IV shows that partial elements of Groups 1 and 3 constitute the data inputs for the Part C analysis of individuals employed in the area.

Comparative Analysis of Particular Variables

In Parts A, B, and C of Volume 1, the data are assembled by state in a format that enables the analyst to examine the relations among clusters of variables for any state. This format also facilitates internal analysis for particular localities, which is usually the starting point in assessment.)

In the Appendix, the statistics are reassembled by particular variables to expedite comparative analysis between geographic units. This capability gives added strength to the inferences the analyst may make about the state, since the comparative framework is incorporated as an integral part of the analysis. For example, the interpretation of an unemployment rate may be ambiguous if based solely on internal analysis of a geographic unit, but if viewed in relation to a series of unemployment rates in other counties or HSAs within the state, a more solidly based and valid conclusion would result.

Guide to Variables Relating to Mobility

Planners must be attuned to the mobility patterns of newly licensed nurses, especially to the net balance between gains and losses in the supply due to residential changes and to some of the factors affecting mobility. Several variables describe these

SCHEMATIC REPRESENTATION OF POPULATIONS STUDIED UNDER PART A, PART B, AND PART C ANALYSES LOCAL AREA REPORTS, EMPLOYMENT AND MOBILITY OF NEWLY LICENSED NURSES

Figure I

Total Populations Studied

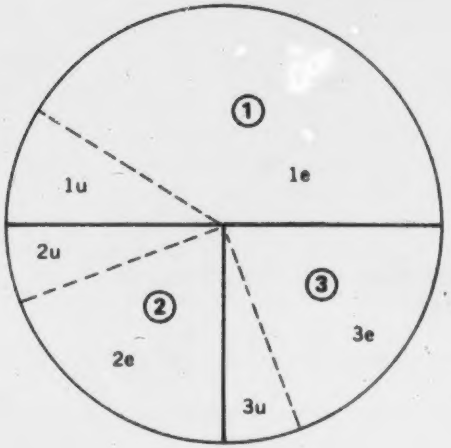

Figure II

Population of Part A Analysis
Residents at Licensure

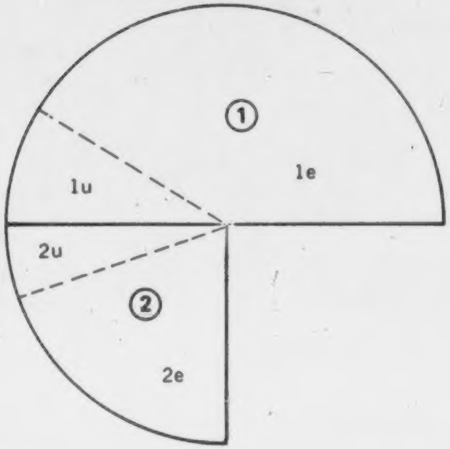

Figure III

Population of Part B Analysis
Residents at Time of Survey (Current residents)

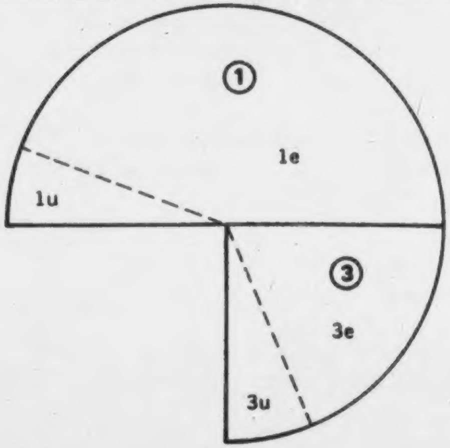

Figure IV

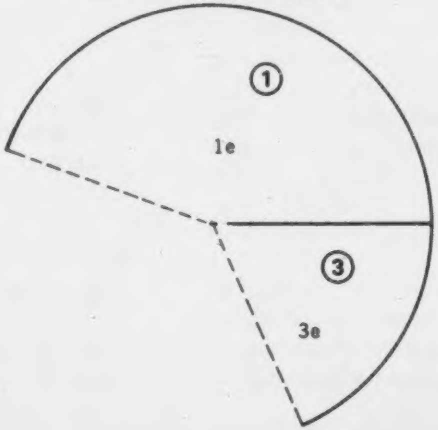
Population of Part C Analysis
Current Employed in HSA



Key to Populations of Study

① Individuals who resided in the HSA at licensure, and continue to reside there at time of survey

- 1e. Employed individuals of above category
- 1u. Unemployed individuals of above category

② Individuals who resided in the HSA at licensure, but who have since departed

- 2e. Employed individuals of above category
- 2u. Unemployed individuals of above category

③ Individuals who resided elsewhere at time of licensure, but reside in HSA at time of survey

- 3e. Employed individuals of above category
- 3u. Unemployed individuals of above category

movements and relationships, as follows:

Variable No.	Description
A-4	Geographic relation of residence at licensure to location of school
A-5	Mobility of newly licensed nurse since licensure
A-6	Mobility since licensure in relation to location of school
A-7 A-8 A-9	Mobility since licensure by educational preparation, marital status, children, and age
B-3	Mobility into HSA since licensure
C-3	Geographic origins of persons employed in HSA
C-4	Relation of residence at licensure to place of employment

Examination of the configuration of these variables for particular states will provide much insight into mobility dynamics. For newly licensed nurses who were educated outside an area, how many returned to the area? How many original residents were lost to migration after licensure, and how do those remaining compare with those leaving in respect to educational preparation, marital status, children, age, and employment status? How many new residents were gained, what is the net difference between gains and losses observed above, and how do new residents compare with original residents with respect to employment status? Finally, what are the geographic origins of the individuals employed in a health service area (HSA)?

Armed with such data, the planner will be in a better position to assess the impact of various dimensions of mobility on supply levels, that is, to determine the relative contribution of mobility to shortages or excesses in supply. In turn, such knowledge will be available to shape or influence public policy for modifying mobility patterns.

Guide to Variables Relating to Employment Status

The analysis of employment status of newly licensed nurses, tabulated in Part B, takes account of these variables:

Variable No.	Description
B-4 B-5 B-6	Employment status for all current residents, and whether employed nurses were residents at time of licensure or new to the area
B-7 B-8	Employment status by marital status and children
B-9	Main reasons for nonemployment
B-18	Employment status of spouse

The information generated in this section has many uses beyond the obvious one of measuring unemployment level among newly licensed nurses. For example, of those not currently employed, how many are voluntarily out of the labor force? Second, what role does lack of job opportunity bear in relation to all other reasons for not working? Finally, how do other variables impinge on employment status, especially such characteristics as marital status and children?

An analysis of the interrelations of all of these variables will lend valuable insight into understanding the current level of supply and for measuring the potential for modifying it.

Guide to Variables Relating to the Circumstances of Employment

The description of the circumstances of employment of newly licensed nurses is found in Part C. A number of parameters for describing the job of the newly licensed nurse, her/his job hunting, and her/his job attitudes are displayed, as shown in the following list:

Variable No.	Description
C-5	Proportion of newly licensed nurses seeking new positions
C-6	Full- or part-time status
C-7	Annual salary
C-8	Number of miles between job and home
C-9	Type of employer
C-10	Type of position held by nurse
C-11 C-12	Perceptions of job availability, by original residents and new residents
C-13	Number of job interviews
C-14	Number of job offers
C-15	Length of time to find job
C-16	Are skills perceived to be adequately utilized?
C-17	Is nurse satisfied with job?
C-18	Number of employer institutions since graduation

The several elements depicting the conditions of employment of newly licensed nurses in this section of the report, when eventually accumulated in a time series, will be invaluable for portraying trends. We call attention especially to variables relating to type of employment, salary, position, and full- or part-time status. However, other data, more novel in concept—especially when considered at the local levels available in Volumes 2-50—will considerably refine the assessment of current demand for nurses. We point especially to the interrelated variables of job hunting, interviews, job offers, and perceptions of job availability. Taken together, these provide insights into levels of ease or difficulty in finding employment and go well beyond a simple index of unemployment. In fact, an unemployment index is insensitive to the supply-and-demand nexus, especially when there are shortages of supply, as has been true in nursing, or even when supply and demand are reasonably in balance. Subtler nuances in the job-hunting experience are needed for more precise definitions of the job market for newly licensed nurses. We believe the above variables offer a reasonable potential for such assessments.

Guide to Variables Relating to Personal Characteristics

Items of information relating to the personal characteristics of newly licensed nurses will be displayed in relation to mobility and employment and as separate descriptions.

Personal items relating to mobility are identified as follows:

Variable No.	Description
A-7	Mobility since licensure by educational preparation
A-8	Mobility since licensure by marital status and children
A-9	Mobility since licensure by age of new licensee

The following personal variables relate to employment:

Variable No.	Description
B-7 B-8	Employment status by marital status and children
B-18	Employment status of spouse

Personal variables unrelated to employment and mobility are identified as follows:

Variable No.	Description
A-2 B-1 C-1	Year of graduation
A-3 B-2 C-2	Type of program from which graduated (RN only)
B-10	Marital status
B-11	Length of time married
B-12	Household configuration of children
B-13 B-14 B-15	Sex by original residents and new residents
B-16	Age of current residents
B-17	Ethnic status of current residents

These data should be helpful in interpreting differences in mobility and employment; in some cases, they may contradict certain hypotheses that attempt to explain differences in mobility and employment.

THE RESPONSE RATE AND INTERPRETATION OF RESULTS

The first variable (A-1) that is displayed in the body of the report shows the response rate to the questionnaire. Table 1 is repeated from the Appendix table A-1 for the national totals.

Table 1
Response Rate to the Questionnaire

	RN	PN
Number mailed	77,032	41,267
Percentage Distribution		
Total	100.0	100.0
Questionnaires returned by nurse	72.1	65.5
Questionnaires returned by post office	2.8	3.0
Questionnaires not returned	25.1	31.5

Of those receiving the questionnaire (which excludes the post office returns), the response rate exceeds 74 percent for RNs and 68 percent for PNs. It should be recalled that this response rate was obtained in two mailings to respondents. Also, the inability of the post office to deliver approximately 3 percent of the mail is significant.

Sampling error has been virtually eliminated in the Survey of Newly Licensed Nurses. Since all newly licensed nurses in the participating states were sent the survey questionnaire, such problems as limits of confidence in responses due to random sampling fluctuations are eliminated.

However, as in all questionnaire surveys, the question inevitably arises as to how the characteristics of nonrespondents influence or bias the results obtained from respondents. Another way of stating the problem is to ask how much and in what directions the aggregate observations of individual items would change if nonrespondents were included in the final results.

There are at least two ways to assemble data on this question: (1) compare respondents and nonrespondents on characteristics known from other data sources and (2) take special efforts to contact nonrespondents through repeated mailings and telephone contacts.

No systematic study of the impact of nonresponse has been made for the 1980 licensees. As a consequence, the results are subject to a degree of unmeasured error. We do not believe, on the other hand, that the presence of such error should lead users to lose confidence in the data or to reject it summarily because the degree of error is unmeasured. The data we are able to present are, without question, superior to the great amount of guesswork that is otherwise invoked for parameters that are examined in the survey.

Independently derived data on differences in response by ethnic status have led us to the general conclusion that there is probably an underenumeration of blacks among the newly licensed nurses based on questionnaire returns. In an analysis of these differences, it is estimated that the national total of blacks among newly licensed RNs would be increased by about one-third if response rates between blacks and whites were more similar.
